

Reduce the risk to your workforce by easily identifying users

Solution Summary

Cisco Duo MFA combined with AWS Workspaces provides an efficient and secure solution for centralized and distributed teams.

Engagement Process

We begin with identifying the requirements specific to your organization. After specifics are determined, After Hour Technology, LLC works with key stakeholders to set goals and modernize workflows based on team workflows and operations.

Differentiator

This solution is ready to use in weeks as instead of months. Competing remote desktop solutions require a large overhead investment of capital expenses such as the management of imaging servers and physical storage.

This solution is FIPS 140-2 compliant without additional configurations required. It drastically lowers the total cost of ownership to operate a high-end security platform for distributed and remote teams.

Impress your Workforce

Teams using the secure solution will be impressed with the straightforward and easy operation.

Easy Software Licensing

Software licensing is simple which creates less overhead for the management of administrative activities.

Symmetric User Identification

Before engaging in sensitive communication, validate the person's identity on the other side of the message or conversation.

Working from home requires organizations to reduce the threat of phishing and impersonation attempts more than ever.
