MELIN RECONDITIONING PROGRAM – Can Make a world of difference

When you choose Melin for your high performance cutting tool, you want the superior performance given by the new tool to be delivered after its reground. You also want as many regrinds as possible. While most end users have their tools reground, many find a reduction in performance compared to a new tool. That's because their service supplier wasn't able to match the specific geometries of the original tool, or replicate the particular coating. As a result, the user has to change cutting parameters on the spindle when the reground tools are run.

To provide our customers with the optimum performance they expect and need, we are making available reconditioning services for selected series of our High Performance drills & end mills. As the original manufacturer, we can in fact, recondition our tools to their original specifications and with our in-house coating facility, we can re-coat them appropriately, with the EXACT coating recipe.

Reconditioning Services are now available for:

Ultra High Performance

Series **MTi4, MTi5 & MTi7**

Variable Helix Carbide End Mills

Series **MNi4, MNi5 & MNi7H**

Variable Helix Carbide End Mills for Inconel

High Performance Drills

Series CDR (2 flute, 140° point, coolant hole style)
