

Excited to Introduce Millennium Ultra Version 3.0.0.

New Product Announcement

Millennium is pleased to announce version 3.0.0. of Millennium's flagship Access Control Security Management System software - **The Millennium Ultra**. Our continued drive to build on a world class user experience with streamlined scheduling, state of the art real time monitoring and third party integrations brings about the improvements in development of our product base.

Ultra is our state of the art web browser-based access control platform designed with a highly scalable architecture capable of supporting one door to thousands of doors across multiple campuses. The new version of Ultra not only features the functionalities you already know and love, but now includes more cutting edge integrations, easy to use components and new operational options.

New Features and Improved Functionalities

Allegion AD400 and AD401 locks integration.

Millennium Ultra can now work with Allegion locks just like with regular doors. One of the big advantages of this integration is the Conditional and Unconditional Lockdown functionality implementation.

Aimetis CCTV integration.

With the Aimetis Symphony integration, operators can assign CCTV cameras to Ultra alarms/events and review recorded video from Alarm/Event monitor or Historical Log page. Real time access to live video feeds from all cameras is also available.

Scheduled reports.

Ultra 3.0.0 allows an operator to create a report schedule and get updated information every hour/day/week/months by email. You can also open reports from the scheduled reports folder on the Ultra server.

Muster Track reports.

This functionality allows operators to generate muster track reports accounting for the last possible swipe in location of a user/employee in a building or room. It is especially important in instances of emergency evacuations.

Cardholder Page disable option.

Ultra now provides the possibility to disable fields for the Cardholder page. Operators can now turn off "Visibility" checkbox with "Operator-Defined fields" page and the field will be disabled.

Automated cardholders import/export.

The Millennium Ultra software is now equipped to automatically update add/delete/update cardholder's information provided by third party applications in text file format.

Hot Commands Group.

Added possibility to create a group for Hot Commands. It will allow an operator to send multiple commands to different tenants with just "one click"

Upgrade from Client Application.

Added possibility to process Ultra upgrade from the client application (Windows client only) without access to the Ultra server.

Now supports PostgreSQL.

This functionality significantly decreases Ultra installation time. Ultra with PostgreSQL leads to a significant up to 70% reduction in installation time depending on the target computer configuration.

Ordering Information

Ultra v3.0.0 software is now available for download by authorized users at www.mgiaccess.com/softwaredownloads. For more information on Ultra v3.0.0, please email sales@mgiaccess.com or contact your Millennium account representative.

*You will need to be logged on to your dealer portal on the Millennium Group website to download the Ultra v3.0.0 software.
