## TARGET MARKET ROOFING

BUILDING TRUST

**Subject: Sarnafil® Textured Roof Membranes**

**16-07**

Sika Corporation – Roofing currently offers Sarnafil G410 and Sarnafil S327 in textured roof membranes, available in gray at 60 mil thickness. Both products are produced from the time proven Sarnafil roof membrane formulations with a unique textured embossing on the top surface of the membrane.

### **Application**

The methods of application for Sarnafil G410 Textured and S327 Textured follow the application guidelines set forth by Sika Sarnafil in adhered roof installations (G410) and mechanically-attached roof installations (S327).

With our current method of production, the textured side of the membrane is “upside down” when shipped to the contractor. As a result, a simple, extra step must be taken by the contractor to ensure proper installation. Upon unrolling the membrane onto the roof substrate, the contractor must flip the membrane before installation, thus making sure the light grey colored, textured side of the membrane is facing up.

### **Additional Information**

[Click here to view](#) the updated Sarnafil G410 Textured and Sarnafil S327 Textured roof membrane Product Data Sheets reflecting this change in application practice.
