Subject: Sikaplan Perimeter Fixation

Currently our requirement for perimeter securement on Sikaplan projects is a minimum of two 5ft (1.5m) wide perimeter sheets. Sika Sarnafil is now accepting the practice for allowing one single 5ft (1.5m) wide perimeter sheet with Sarnafast systems and a 5ft (1.5m) wide perimeter area with RhinoBond systems **(to be done in conjunction with required RhinoBond fixation patterns for the field, perimeters, and corners)**. The following highlights criteria which must be met and followed.

- 1) Only to be used on **non FM insured** Sikaplan projects.
- 2) Only to be used on buildings with a max building height of up to 40ft (12.2m) regardless of plan dimensions.
- 3) Only to be used on approved steel decks of 22ga or heavier, structural concrete, or ½in or greater plywood (plywood must be a min. of 5 plies).
- 4) Only to be used on projects covered by Sikaplan Standard and System warranties **(not applicable to “NDL” type warranties or greater than Gale Force winds)**.

It is up to the designer and/or the contractor to verify and/or confirm code compliance.

For further information regarding these changes please contact Sika Sarnafil's technical department.
